

HYGIENIC MEANS

ABSTRACT OF THE DISCLOSURE

The invention relates to a male hygienic means intended as dribble protection after urination. The means comprises a sheath (1) preferably containing an absorbent material to be fitted at the tip of the penis, fixing strips (2) with adhesive surfaces on opposite sides of the sheath, and a rip tag (7) protecting the adhesive surfaces before the means is fixed. In accordance with the invention, the principally U-shaped rip tag (7) extends around the front side of the sheath tip and its opposite ends (8) adhere to the laterally bent fixing strips (2) of the sheath (1). The user may fix the means into position by pushing his fingers between the opposite sides of the sheath (1) and the rip tag (7), so that with one single pulling motion, he can fix the fixing strips to the flanks of his penis and release the rip tag.
